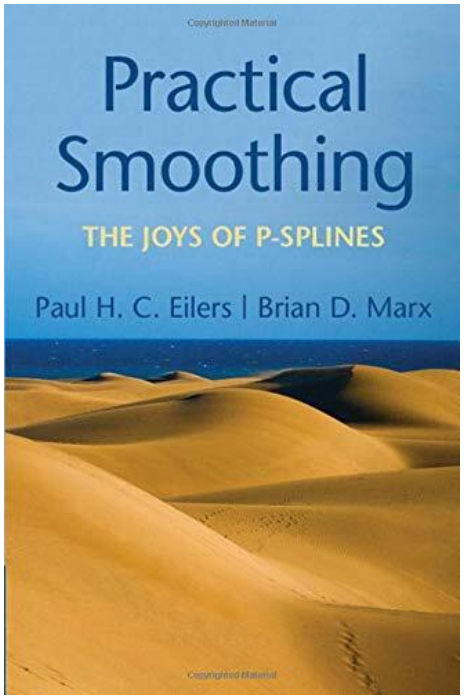
Some references (I)

- "Practical Smoothing: The joy of P-splines" by Paul Eilers and Brian Marx (2021)



- `R` package `JOPS` in CRAN
- Highly recommended (my personal favourite)
- For beginners and practitioners
- Reproducible code to play with P-splines

- All book R code and additional material available at https://psplines.bitbucket.io/

Some references (II)

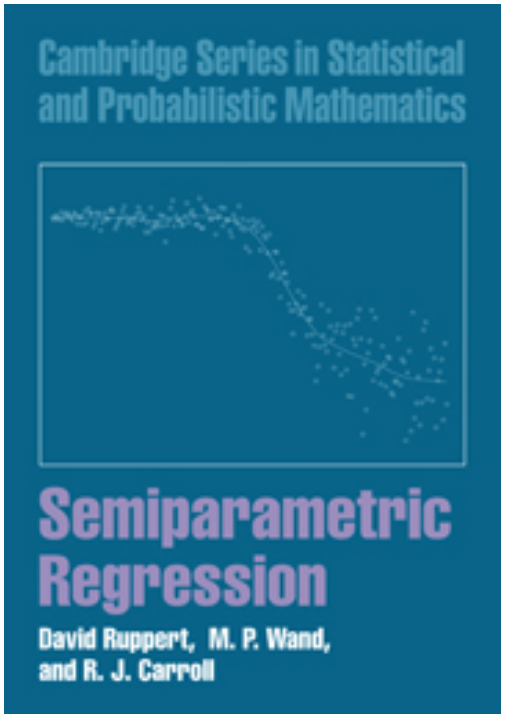
- "Generalized Additive Models: An Introduction with R" by Simon N. Wood (2006)

  - A very complete and well-written book
  - It covers several regression models from linear to generalized linear models, mixed models and generalized additive (mixed) models
  - For those interested in mathematical and statistical aspects (including estimation and inference)

- `R` package `mgcv` by the author, and 2nd Edition in 2017.

Some references (III)

- "Semiparametric regression" by D. Ruppert, M.P. Wand and R.J. Carroll (2003)

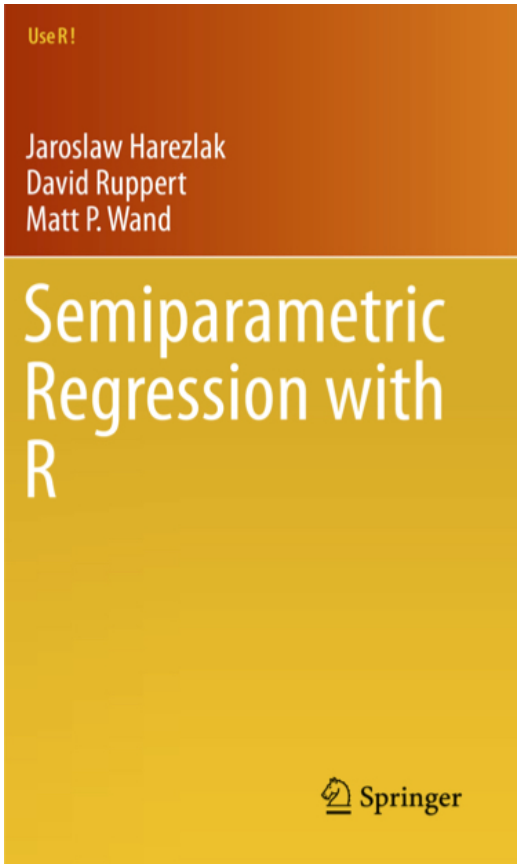


- An old classic (a little bit outdated), but still a well-written book
- Several examples and applications
- Extensive review of semi-parametric regression

- `R` package `SemiPar` by the authors (not very popular these days).

Some references (IV)

- "Semiparametric regression with R" by J. Harezlak, D. Ruppert, M.P. Wand (2018)



- A follow-up of Semiparametric regression book of 2003
- Several examples and applications
- Extensive review of semi-parametric regression
- `R` package `HRW` by the authors.
